1 Introduction

This report presents the results of an archaeological survey conducted at Churchtown Graveyard, Curchtown, Co. Kerry (Figure 3). The work was undertaken in accordance with survey specifications provided by Kerry County Council.

The report comprises an accurate plan showing boundaries, the location of paths and desire lines, gravemarkers, tombs, architectural fragments, extant remains of churches or buildings and dangerous areas of ground collapse. A photographic survey of headstones and gravemarkers is linked back to the survey drawings. Also included in the survey are written descriptions of buildings, cross-slabs and early enclosures; statements on the condition of these buildings; suggested suitable/necessary remedial action that may be needed to secure these structures; breaches of the boundary walls, open or collapsed tombs and the condition of paths and entrance gates. A photographic survey of damaged and dangerous structures or features is also included.

2 Site description and location

Churchtown graveyard is located within the townland of Churchtown in County Kerry, 12 km west of Killarney (Figure 1). Lough Laune and the MacGilly Cuddy's mountains are located 5.5km and 4km to the west and south respectively. The Gaddagh River is located 1km directly west of the graveyard. The graveyard is located on the west side of a rural road. Inspection of the 1st edition OS map reveals that there were no substantial settlements nearby during the early 19th century, with the nearest being Beaufort approximately 3km to the west. The name of the oldest church in the graveyard, Knockane Church, is depicted on the 1st edition OS map. It also states that it was in ruins at this time. It also shows the other more modern church next to it as well as mentioning a tomb in the graveyard, MacGilly Cuddy's Tomb (plate1).

The older part of the now expanded graveyard is generally rectangular in plan except for an triangular projection to the northeast. It is surrounded by a mortared rubble stone wall with a render capping and rubble stone crenulations. There are 4 entrances to the graveyard, two in the east boundary, one in the south-west corner by the entrance to the new graveyard and a fourth which links the original graveyard with the modern extension in the north-east corner. Located to the east is the recent rectangular plan graveyard, this is enclosed by linear boundary walls of concrete with occasional square-profile piers. The interior can be accessed from the earlier graveyard through an opening in the earlier boundary wall (to the northeast corner of the original graveyard) or through a separate gated entrance in the southwest corner. There is also a now disused stone stile located to the northeast corner near one of the entrances on the east wall.

The graveyard is recorded in the Record of Monuments and Places (RMP) as KE065 012003, and contains the ruinous remains of one churches listed as KE065-012001 (Knockane Church). The church remains, along with the later church (derelict), are located in the north-western part of the grounds. The grass was cut at the time of the survey and no desire lines were evident. The interior has an even well maintained grass surface which slopes gently toward the southeast.

3 Methodology

A site survey was carried out in October 2009 by a team of two surveyors. An electronic survey was conducted on the Irish National Grid using a Trimble GPS R6 base and rover. The GPS was supplemented with a Leica TCR407 Total Station and Panasonic Toughbook Rugged Tablet PC with Penmap software when necessary due to tree cover and a resulting loss in GPS signal. All grave plots, gravemarkers, headstones and tombs were surveyed in plan as were any structural remains, boundary walls, openings, paths and desire lines. Finished survey files were exported to AutoCAD where final edits were made.

Individual graves and / or associated markers or headstones were assigned a unique 3 digit grave number on the digital survey whether the latter was being carried out using GPS or Total Station and Panasonic Toughbook.

The photographic elements of the survey were accomplished using a Canon G9 digital camera. The camera was set to assign a consecutive sequence of unique photo numbers throughout the survey. These numbers were cross-referenced with grave numbers in a photo register.

Appendix 1, 2, 3 and 4 were created using a Microsoft Access relational database using two tables. One table relates to the graveyard and the other relates to the graves, tombs and architectural features. Filtered reports were then used to create the appendices.

The descriptions throughout were compiled using standard National Inventory of Architectural Heritage (NIAH) terminology and methodology where suitable, with guidelines and techniques from other established UK and Irish government sources being respected throughout (NIAH 2006, RCHME 1996, RCAHMS 2004, DEHLG 2001, EH 2004 and 2006). In addition, terminology and methodology was cross referenced to standard texts of buildings archaeology and architectural history (Curl 1999, Morris 2000, Robertson 1990).

4 Results

4.1 Boundaries

The boundary around the graveyard is a coursed mortared rubble stone wall with a render capping and rubble stone crenulations. The eastern wall by the road is well maintained and free of any vegetation or collapse (plate 2); whereas the north and south walls are very overgrown (plate 3). The west wall is almost level with the ground on the interior of the old graveyard but is approximately a metre high from the exterior (plate 4). No areas of collapse or breaches within the boundary were visible. The walls to the recent burial ground are of rendered concrete, having chamfered render coping and square-profile piers with render caps.

4.1.1 Recommendations

The walls appear to be stable and periodic monitoring should be carried out to ensure that this remains the case. The encroaching vegetation should also be monitored and controlled, preferably in such a way as to preserve the natural habitats that this vegetation provides for local wildlife.

4.2 Entrance

1

There are 3 main entrances to the graveyard. One gated entrance in the north end of the east wall (plate 5), with a now disused stone stile located next to the gate (plate 6). Another entrance in the same wall, at the southern end, is a modern wrought iron removable stile with a cross motif (plate 7). The third main entrance is located in the south-west corner, where an older entrance may have existed, as is evidenced by the breach in the wall and as shown in the OS Historic Maps a road led up to this point. A more recent construction of concrete steps and walls seems to have replaced the original entrance (plate 8). The only other entrance/exit to the original graveyard is what seems to be a deliberate breach in the wall in the north-west corner to link the original graveyard with the more recent extension (plate 9). The entrance to the recent burial grounds consists of a gateway in the south-east corner, having rendered square-profile piers and a metal gate, with a narrow stile to its right as you enter (plate 10).

4.2.1 Recommendations

The entrances to the graveyard are in good condition. The gates should be treated for rust and painted as and when such measures are needed, and continued to be kept clear of vegetation and debris.

4.3 Pathways

The only pathway in the original graveyard leads from the main gate at the north-west corner to the more recent derelict church where it ends (plate 5). It is being slightly encroached from the north by vegetation growing out from the north wall.

Tar macadam lined pathways run around the periphery of the modern graveyard and also transects the centre running east-west and north-south (plate 33).

4.3.1 Recommendations

Clearing of encroaching vegetation to the path could be carried out by hand and without the use of broad spectrum weed killers.

4.4 Desire Lines

There are no visible desire lines within the graveyard.

4.5 Named and unnamed tombs (Appendix 3)

There are 25 tombs located within the graveyard. These are mostly located to the west and south-west of the graveyard with a few located to the east of the 2 churches. Of the 25 tombs, 9 have retained their name plaques in a legible state, while others have been weathered and overgrown beyond recognition as in the case of grave no. 463 (plate 11). The most striking tomb was grave no. 467 which is mentioned in the OS Historic Maps as MacGilly Cuddy's Tomb. It is a rectangular profile tomb comprising of ashlar tooled limestone walls with octagonal turrets having pinnacles. It has a low hipped limestone roof having tooled limestone pedestal surmounted by an urn. There is also a

decorative carved limestone commemorative plaque to front (The McGillycuddy Tomb AD MDCCCXX) above a carved limestone shield having family crest and motto (plates 1 and 12).

4.5.1 Recommendations

The overgrowth of vegetation on a majority of the tombs should be monitored and controlled, as for the other better kept tombs this standard of maintenance should be maintained.

4.6 Inscribed headstones and grave plots (Appendix 1)

A total of 227 inscribed headstones and grave plots were surveyed.

There is a wide variety of headstones and grave plots throughout the graveyard that range in date between the early 19th century and early 21st century. The latest dates to 2007 and the oldest determinable headstone is erected for Darby Connor and dates to 1806 (plate 13). The graves conform to a rough plan with all of the upstanding headstones facing east. Graves of the name O'Sullivan, O'Connor, Coffey and Doyle make up a large percentage of the overall named headstones and grave plots. O'Sullivan is the most common name to be found on the marked headstones and plots, with the next most common names being Doyle, Coffey and O'Connor.

4.6.1 Recommendations

In general the headstones and grave plots around the graveyard are in good condition and as such should not be interfered with. Continued close monitoring and upkeep of the grounds should ensure that this continues.

4.7 Unnamed headstones and gravemarkers (Appendix 2)

A total of 13 unnamed headstones were surveyed.

The detail on most of these has been eroded away over time (plate 14), and in some cases the headstones themselves are broken as is the case with Grave no. 381 (plate 15). There are also a number of plots which no longer have headstones within the plot-markers or are still empty plots (plate 16).

4.7.1 Recommendations

In general the headstones and grave plots around the graveyard are in good condition and as such should not be interfered with. Continued close monitoring and upkeep of the grounds should ensure that this continues.

4.8 Unnamed gravemarkers (Appendix 3)

A total of 253 unnamed gravemarkers were surveyed.

The majority of gravemarkers are rubble stones indicating the place of a burial. The graves are often placed in seemingly random locations and in some cases have a large amount of vegetation growing on and around them, sometimes to the point of obscuring them completely. These gravemarkers indicate a lower class status and were particularly prevalent during the Famine period. Also included are three unnamed iron crosses, grave nos. 048, 063 and 420 (plate 17).

4.8.1 Recommendations

These gravemarkers should be cleared of vegetation and the grounds routinely mowed in order to improve the visibility of the obscured stones. The iron crosses are in good condition, should be kept clear of vegetation and debris and could be treated to prevent further rusting and deterioration.

4.9 Church in ruins

To the north-west end of the graveyard are the ruinous remains of one church, listed on the RMP as KE065 012001, and the derelict remains of another more recent church.

The earlier church is a single cell double-height church surviving to a maximum height of approximately 6-8m, with the gables to the east and west elevations with vegetation throughout (plates 18 and 19). In the south wall there is a pointed arch door opening with dressed rubble stone surround and voussoirs, having a cumberhead (plates 20 and 21). The east elevation of the church contains a narrow square-headed window opening with a stone sill and lintel, surmounted by a possible oculus window having a dressed rubble stone surround above (plate 22). There are three other visible window openings, one on the south elevation (plate 23) and two on the north elevation (plates 24 and 25). There are also three square headed recesses within the church, one in north of the east elevation (plate 26) and two in the east of the south elevation (plate 27). Also in the north elevation we find a rounded arch recess with dressed stone voussoirs (plate 28), as well as a stoup located at the east end of the aforementioned wall (plate 29).

The exterior of the church is totally overgrown with vegetation but the interior only partially so. Hazard tape had been placed at both gable ends to prevent people going too near.

The more recent church, located 3m to the north and running parallel to the older church, is a free standing double-height Church of Ireland church, built c.1812 (plate 30). It comprises of a 3-bay nave with a 4-stage bell tower to the west elevation and a single-bay, single storey porch to the north elevation. It has a pitched slate roof to nave and porch having corbelled tooled limestone gable copings and the remains of cast-iron rainwater goods. It has rendered rubble stone parapet to bell tower with rudimentary crenellations and a roughcast render over rubble stone walls, having rendered banding between stages of the tower. It has pointed arch window openings with chamfered ashlar limestone sills and block-and-start surrounds to the nave. Having six-over-six pane timber sliding sash windows surmounted by intersecting timber traceried overlights. The window to the east elevation has been removed with the interior red brick surround and voussoirs visible (plate 31). There are also pointed arch door openings throughout having tooled limestone or red brick surrounds and voussiors.

In general the exterior of the more recent church is in good condition, but the interior has exposed beams on the floor from floorboards being removed as well as a large amount of rubble and other building material scattered about the floor (plate 32), which is a health and safety issue that should be dealt with.

4.9.1 Recommendations

Measures should be taken to secure the existing ruin from any/further collapse. This could primarily be achieved through the control of the attached vegetation and preventing it from spreading further. The Ivy should not be removed however as this would leave the remains in need of immediate conservation, without which structural collapse may occur. The re-pointing of the walls using correct (lime) mortars with flush or recessed pointing would also greatly benefit the structure and help secure it from further collapse. Ribbon pointing however, must be avoided as its use would damage the structures historic character. The removal of the Ivy would also result in a loss of habitat and should be avoided.

The later Church of Ireland church should be cleared of any hazards and the open door in the porch should be repaired and locked. Also the opening in the east elevation, where the window used to be, should be closed up to prevent any more damage to the interior like wind and water damage.

5 Summary of recommendations for future management / conservation

- The vegetation throughout Churchtown graveyard should be brought under control and tended to regularly in order to prevent the degradation and collapse of the enclosing walls and interior features including tombs, gravemarkers and headstones.
- The use of broad spectrum weed killers should not be used during the clearance of vegetation under any circumstances.
- The removal of grass and other deeply rooted vegetation should be carried out under archaeological supervision in order that the full extent of some of the concealed and partially concealed burial markers and tombs may be exposed without damaging them.
- A rust treatment and fresh coat of paint should be applied to gates regularly to prevent degradation.
- The addition of clearly identifiable gravel pathways would greatly benefit the grounds by reducing foot traffic on inappropriate areas. This would prevent any further damage to graves and gravemarkers underfoot and health and safety concerns due to the uneven surface and obscured gravemarkers.
- Measures should be taken to secure the church ruin from further collapse through the removal of all vegetation from the walls and then re-pointing of the structure using appropriate materials.

- The publication: The care and conservation of graveyards by the office of public works should be consulted prior to the carrying out of any maintenance work on the burial grounds or church.
- An information board presenting historical and archaeological information would make an excellent addition to the site.
- All primary ground works should be archaeologically monitored and all features recorded and protected.
